

Harmony

a unified, AI-infused platform

One Platform. From Integration to Agentic AI at Scale.

According to the 2026 Jitterbit AI Automation Benchmark Report, over 90% of enterprises have already deployed AI agents. At the same time, integration is becoming more complex and harder to control. Systems, data and workflows are increasingly fragmented. Innovation is outpacing enterprise controls, introducing risk across security, governance and compliance.

Jitterbit Harmony addresses these issues by combining iPaaS, app development, APIM and EDI for seamless, end-to-end integration and intelligent automation at scale. It simplifies orchestration of complex workflows securely, with built-in governance, AI accountability and compliance. It removes friction across systems and enables consistent, scalable control.

Layered AI & Low-Code Automation Architecture

By combining MCP, AI assistants, agents and low/no-code automation Harmony lets *all* users quickly and easily design, deploy and manage secure, end-to-end automation— from standard business workflows to advanced AI agents.

This modular approach extends to prebuilt integrations with LLMs such as OpenAI, Azure OpenAI, Google Gemini, Amazon Bedrock and others. This enables flexible access to best-fit AI capabilities and prevents vendor lock-in, giving you the freedom to adopt and evolve your AI strategy without constraint.

A Modern Approach to Automation

AI-Infused, Unified Platform

Our layered AI architecture provides a modern, secure approach to end-to-end business automation, boosting productivity and unlocking value.

Security First

Harmony is ISO 42001 certified, meeting global standards for responsible AI. It ensures trusted, governed, and compliant AI use across the enterprise. Our hybrid security strategy (physical, organizational and logical security) is based on NIST, CISA, and CERT frameworks.

Ease of Use

An intuitive, responsive user interface that is accessible to both technical and non-technical users.

Agentic AI

Designed with security, governance and accountability as the foundation, our layered AI architecture, allows you to operationalize agentic AI with control and confidence.

Time to Value

Harmony's average 'time to go live' of 1.74 months is much quicker than the industry average (3.47).¹

iPaaS

Build, manage and maintain integrations that work seamlessly with APIM, App Builder and EDI. Integrate across hybrid, cloud and on-prem apps with drag-and-drop simplicity. Enable teams to deploy and optimize workflows collaboratively. Seamlessly integrate and orchestrate apps and services. Connect endpoints and build entire data workflows between them using just natural language.

API Manager

Streamline API creation, control and consumption through a modern, user-friendly interface. Transform integrations into APIs using low-code tools and powerful AI assistants. Ensure timely data exchange and system connectivity. Get comprehensive control, security and visibility across the entire API lifecycle.

App Builder

Use natural-language commands or low-code capabilities to create scalable, secure and compliant web and mobile apps fully integrated into your tech stack. Consolidate data and functionality from multiple sources to create everything from simple dashboards to a system-level enterprise control center, and even embed custom AI agents within your apps.

EDI

Manage B2B transactions in a seamlessly integrated platform. Use natural language to connect with ERP systems, automate end-to-end workflows, and leverage over 1,000 pre-built trading partners. Monitor transactions from a single dashboard and leverage AI-driven insights to optimize workflows and reduce errors.

Model Context Protocol (MCP)

Leverage enterprise-grade Model Context Protocol with Jitterbit MCP and enable scalable agentic AI within the Harmony platform. Transform existing APIs and integrations into secure, governed and reusable capabilities. Support MCP server creation and management without custom development. Deploy AI responsibly with built-in security, governance, compliance and execution visibility.

AI Agents

Build, test, manage and deploy pre-built and custom AI agents. Centrally orchestrate autonomous task automation across business processes and complex workflows, driving greater efficiency and scalability.

AI Assistants

Boost productivity across iPaaS, App Builder, API Manager and EDI. Remove technical friction and simplify complex tasks with guided, natural language capabilities. Empower even non-technical users to easily design integrations, manage EDI, build APIs and create apps. Enjoy faster delivery, improved efficiency and stronger execution across teams.

Marketplace

Find and utilize a wide range of certified pre-built integration solutions, connectors, templates, AI agents and services – all designed to accelerate and simplify countless integration and workflow automation initiatives.
